TITLE: Amperometric Determination of Magnesium with a Rotating Platinum Electrode (Amperometricheskoye opredeleniye magniya s vrashchayushchimsya platinovym elektrodom)

PERIODICAL: Sb. nauchn. rabot. Mosk. in-t nar. kh-va, 1957, Nr 10, pp 335-342

ABSTRACT: The possibility of amperometric determination of Mg by means of its precipitation with a solution of Na_2HPO_4 at 10.5 pH (established by an ammonia buffer solution) is established. The titration is carried out with a rotating Pt electrode at 1.9 v (saturated electrolyte). In solutions of pure salts in the determination of $4.88 \cdot 10^{-3}$ - $6.08 \cdot 10^{-6}$ g Mg the error is $\leq 3.5\%$. In the presence of Ca it is first precipitated with a concentrated solution of $(\text{NH}_4)_2\text{C}_2\text{O}_4$, and the Mg is titrated without separating the precipitate.

TITLE: Capillary Contraction in Films of Gels and Porous
Dispersed Substances While in Progress of Drying
(O kapillyarnoy kontraktsii pri vysykhanii v
plenkakh-sloyakh geley i poristykh dispersnykh tel)

PERIODICAL: Doklady Akademii Nauk SSSR, 1958, Vol. 118, Nr 4,
pp. 751-754 (USSR)

ABSTRACT: This work examines by direct, though summary methods, the
forces of capillary contraction (F_c) in drying films of
high molecular and dispersed systems on dynamic conditions.
Besides the kinetics of the development of these forces
during the process of drying out are investigated.
These forces cause shrinkage, decrepitation, distortion,
tensions, and cavities, and other still insufficiently
investigated phenomena. In spite of the importance of the
capillary forces for these phenomena also the cohesion
interaction between the particles of the solid phase or
the macromolecules has to be considered. To a certain

Card 1/4

Capillary Contraction in Films of Gels and Porous
Dispersed Substances While in Progress of Drying

20 -118-4-35/61

degree also the forces of the coagulation attraction become manifest. With increasing distance of the liquid rests the influence of the surface of the solid phase becomes more and more marked. In case of absolute drying out the capillary forces vanish and the action of the intermolecular (cohesion-) forces remains in a pure form. Consequently the forces of the capillary contraction are a composed quantity which requires an extensive study. The authors here use for their measurements a device by which F_g can be measured during the whole process of drying out. The lamellar samples were produced i.g. of cement powder with a small admixture of pulverized fibrous asbestos. A diagram illustrates the development of the curves of the capillary contraction in case of the drying of two cement samples, which before for the purpose of hardening were left for different periods in a moist medium. The duration of the consolidation of the cement influences the forces of the capillary contraction. Until the setting of the

Card 2/4

Capillary Contraction in Films of Gels and Porous
Dispersed Substances While in Progress of Drying

20-118-4-35/61

cement these forces show up only very weakly. Similarly the dependence of F_{σ} on the duration of the previous consolidation, of the cement samples was investigated and the results are illustrated by diagrams. The development and the consolidation of the structure increases the value of F_{σ} . In all samples F_{σ} in all stages of drying until reaching the maximum of F_{σ} decreased quickly to zero under the action of steam and on isothermal conditions. In the case of action of benzene vapour on the sample F_{σ} is much decreased. This is also valid to a smaller degree for phenol. These and other here given phenomena speak for the following: In case of sharp changes of the moisture of superficial cement layers and also of other organic and anorganic hygroscopic materials on atmospheric conditions an uninterrupted and very complicated interaction of opposite, but permanently combined molecular surface forces of capillary contraction, which decrease the strength of the adsorption hydrate layers, takes place. These forces cause the corrosion of the concrete

Card 3/4

Capillary Contraction in Films of Gels and Porous
Dispersed Substances While in Progress of Drying

and many other phenomena in nature and technology as well.
There are 3 figures, and 8 Soviet references.

USSR/Vaccine- Influenza vaccines

Oct 53

"Investigation of the effectiveness of anti-influenza vaccine in the USSR in 1952-3,"
I. N. K. Golov, A. N. Gerasimov, I. S. Klyuchareva, A. I. Danilova, Senior of Epidemiol,
Influenza Lab, Leningrad Inst of Pasteur; Leningrad City San-Epid-Sta

Zhurikova, L. I. Izv, 10 10, pp 17-25

In Nov-Dec 52, intranasal mass immunization was carried out with anti-influenza
polyvalent vaccine prepared at the Leningrad Inst of Epidemiol and San-Epid-Sta. The method
proposed by A. A. Sheregin and G. N. Gerasimov (Inst of Med Biol, Leningrad San-Epid-Sta).
This was the 1st annual test in Leningrad of anti-influenza immunization. On the
whole, reduction of the incidence of influenza in Leningrad in 1952-3 was not achieved with
the aid of the vaccine mentioned. Because of the low infectivity of the vaccine, the
attempted mass immunization did not succeed.

TITLE: Concerning Thermal Decomposition of Organosilicon Compounds

PERIODICAL: Zhurnal obshchey khimii, 1960, Vol 30, Nr 1, pp 235-239 (USSR)

ABSTRACT: Thermal decomposition of organosilicon compounds was studied in order to obtain pure silicon. According to the data obtained by Ch. E. Waring (Trans. Farad. Soc., 36, 1142, 1940), the thermal decomposition of tetraethylsilane can be expressed:

Card 3/4

Concerning Thermal Decomposition of
Organosilicon Compounds

77391
SOV/79-30-1-52/78

The following conclusions are made: The solid products of decomposition of organosilicons always contain silicon and carbon (10-40%); the amount of carbon in the solid products of decomposition increases with rising temperature; there is no dependence between carbon content in the initial compounds and in the solid products of decomposition; admixtures, which are present in the initial compounds, pass fully into the solid products of decomposition, except Mn and Na. TITLE: The phase diagram of the GeTe - bismuth telluride system

SOURCE: AN SSSR. Izvestiya. Neorganicheskiye materialy, v. 1, no. 1., 1965, 57-59

TOPIC TAGS: bismuth telluride, germanium telluride, phase diagram, semiconductor, solid solution

ABSTRACT: The phase diagram of the Bi₂Te₃ - GeTe system (see Figure 1 of the Enclosure), drawn on the basis of thermal and metallographic studies, shows that on addition of up to 25 mol.% GeTe to Bi₂Te₃ the temperature of incipient solidification decreases, after which it steadily increases up to GeTe. Solid solutions extend at 500C up to 17.4 mol.% GeTe. Three intermediate phases with Bi₂Te₃ and GeTe in the ratios of 2:1, 1:1 and 1:3 are formed: GeBi₄Te₇ by peritectic reaction at 564 C, providing a base for solid solutions extending from 30-35 mol.% GeTe; GeBi₂Te₄ by degenerated peritectic reaction at 584C; Ge₂Bi₂Te₆ also by a peritectic reaction at 650C. Orig. art. has: 1 table and 4 figures.

TITLE: Study of the phase diagram of the antimony tritelluride-germanium telluride system

SOURCE: AN SSSR. Izvestiya. Neorganicheskiye materialy, v. 1, no. 2, 1965, 204-207

TOPIC TAGS: tellurium compound; semiconductor material; phase diagram; thermal analysis

ABSTRACT: The Sb_2Te_3 -GeTe system was investigated by means of thermal analysis and by microstructural analysis. The alloys were prepared from GeTe and Sb_2Te_3 . The specimens were fused at 10^{-4} mm residual pressure in sealed quartz ampules. Following this the alloys were annealed in sealed ampules filled with argon at 0.5 atm for 1000 hours at 500°C. For microstructural analysis the alloys were etched in a solution consisting of 1 cc HCl, 90 cc alcohol and 6 g of $CuCl_2$. On the basis of these studies a phase diagram was constructed for the Sb_2Te_3 -GeTe system (see fig. 1 of the Enclosure). The electrical conductivity and the thermal emf of the annealed

Card 1/12

L 55960-65

ACCESSION NR: AP5009369

alloys were investigated as a function of the composition of the alloy. The results of these measurements are shown in figs. 2 and 3 of the Enclosure. It was found that the solid solution exists on the Sb_2Te_3 side of the diagram up to 10 mol % $CeTe$. The existence of three intermediate phases was also established: $CeSb_2Te_3$, $CeSb_2Te_4$, and $Ce_2Sb_2Te_5$. Orig. art. has 2 tables and 3 figures.

"High Asphyctic T Waves in Precordial Leads as an Early Symptom of Acute Coronary Occlusion."

Belgrade, Srpski Arhiv za Celokupno Lekarstvo, Vol 91, No 6, June 1963, pp 605-609.

Abstract: [Authors' English summary modified] The article reports on two patients who suffered from typical protracted anginous pain and who displayed giant T waves in the precordial leads from V₁ to V₄. One of the patients had been forwarded from an out-patient clinic with a diagnosis of neurocirculatory dystonia. The electrocardiographic pattern characteristic of coronary occlusion was found in the precordial leads of both patients. In the assessment of such a pattern, we must be very alert and note all elements suggestive of acute coronary occlusion so as to eliminate the possibility of other ailments with a similar pattern and to permit rapid and accurate diagnosis and treatment.

Two illustrations, one Swiss and five Yugoslav references of recent date.

<p>DANILAVITCH H</p> <p>B-I-2</p> <p>A. DANILAVITCH and T. DAKINA (Maslob. Khir. Delo, 1936, 18—18).—Petroleum hydrocarbons yield water-white fatty and OH-fatty acids by oxidation by a 4- or 5-stage procedure (12 or 24 hr. in each stage), using Cd naphthenate as catalyst. The Na soaps of these acids are satisfactory wetting agents. They become translucent if exposed to air in paper wrappers, but remain unchanged in a sealed vessel. Ch. Ans. (c)</p>

PROCESSES AND PROPERTIES INDEX																			
<p>LA</p> <p>Synthetic fatty acids produced by oxidation of kerosene. I. P. Lacey, A. J. Danforth, Jr., and A. D. Koon. <i>Acad. Chem. Trans.</i> 1943, No. 3, 11-14. Catalytic oxidation at 100° with 500 l. of air per hr. per 200 g. of kerosene favors hydroxy acids as end product. A suitable catalyst is 1.0-1.5% of a Mn salt of an acid such as stearic. The yield of hydroxy acids was 75% after 24 hrs. and increased to 90.07% (of total acids formed) after 100 hrs. The hydroxy acids are suitable for use in plastics, for condensation with phenol CH₂O, for use in varnishes, and for the prepn. of drying oils. The production of carboxylic acids is favored by Ca naphthenate as catalyst. The process requires 4-6 hrs. at 110-15°. Under these conditions the total yield of acids was 4.75-7.4% of the starting material and 15.8-37% of the material used up. Of this the carboxylic acids amounted to 3.32-5.6 and 11.28%, resp. The return kerosene was 70-85% - 1.2% of the starting kerosene or 8.2% of the kerosene used up computed volatile acids (caught in traps of the oxidation train). These contained formic, acetic, and propionic acids. As the time of oxidation increased the quantity of volatile acids increased. Unpurified kerosene yielded more hydroxy acids (37.5-43%) than H₂SO₄-washed kerosene (12.6-22.3%). Bu esters of the carboxylic acids, bp 180-225° or higher, are suitable as plasticizers for polychlorovinyl resins. M. Hosh</p>

Title : Sanitary and hygienic evaluation of the layout of a multistoried dormitory. (From sanitation practice)

Periodical: Gid. i san., 3, 37-39, Mr 1955

Abstract : Describes and illustrates with a plan, the five-story stone house, a dormitory for working women, built in Moscow in 1951, and indicates its shortcomings from the hygienic point of view. However, many of the defects were eliminated in subsequent projects of the same type (1953-1954).

Institution: Medical and Epidemiological Station, Stalin District, Moscow
